Allowable Subject Matter

1. Claims 1-22 are allowed.

Regarding claim 1, Walton et al. (US 2003/0125040) teach a method of controlling data transmission in a multiple-input multiple-output (MIMO) in which post-detection signal-to-noise ratio (SNR) is obtained and is used to feedback from the receiver to the transmitter for selecting coding and modulation scheme as well as for assigning antennas at the transmitter ([0142]-[0161]). Lozano (US 2003/0076797) teaches using long term SNR feedback from the receiver for adjusting the data rate at the transmitter for a sufficient large number of antennas or diversity ([0004], [0012]-[0046]). Horng et al. (US 2004/0204104) teach a MIMO as set forth above in which data rate transmitted from the transmitter is adjusted from the SNR determined and feedback from the receiver ([0009]-[0016]). The above references either alone or in combination fail to teach determining a data rate for each of the plurality of transmit antennas based on the post-detection SNR for the transmit antenna, wherein the data rate for each transmit antenna is set to zero if the post-detection SNR for the transmit antenna is worse than a minimum required SNR, and wherein a plurality of data rates are determined for the plurality of transmit antennas for the

ordering; computing an overall data rate for the ordering based on the plurality of data rates for the plurality of transmit antennas; repeating the evaluating, determining, and computing for each of a plurality of orderings; and selecting one of the plurality of orderings based on overall data rates for the plurality of orderings, wherein a plurality of symbol streams are sent from the plurality of transmit antennas at the plurality of data rates for the selected ordering, and wherein the plurality of symbol streams are recovered at a receiver in accordance with the selected ordering.

Regarding claims 9, 17, 22, the claims are allowable for the same reason as set forth in claim 1.
